Material which comprises polyurethane or polyurethane urea obtd. by
reaction of diisocyanate, polysiloxane contg. hydroxy or amino
terminal reactive to isocyanate radical, and polyether polyol contg.
tert. amino gp., with opt. other polyamine or polyol. Part or all of
the tertiary amino radical is formed into quat. chloride, using alkyl
halide or active ester. 7-16C are contained in radical of side chain
binding to the quat. nitrogen chloride.

- Pref. polyether polyol contg. tertiary amino contains 50 mol% or more
of diol of formula (I) where R1, and R3 = H or 1-3C alkyl; R2 = 1-10C
alkyl. The material is treated with heparin.

- 4-methyl-4-aza-2,6-heptane diol (1472 wt.pts.), 1,6-hexane diol (591),
and phosphorous acid (12.3) are reacted at 200-220 deg.C for 26 hrs.
and at 220 deg.C in 760 mmHg-0.3 mmHg for 5 hrs. to form an amino
polyether polyol (a). Polydimethyl siloxane diol (1800) of formula
(3), amino polyether polyol(a) (300), 1,4-butane diol (90.1), dibutyl
tin dilaurate (0.3), and 4,4'-diphenyl methane diisocyanate (545) are
added in solvent of tetrahydrofuran (1994) and dimethyl formamine
(3887) and reacted at 40 deg.C for 1 hr. and at 60 deg.C for 15 hrs.
to form base polymer soln. A. Hexyl iodide (4.589) is added to 1 10%
base polymer soln. of DMF (100) and stirred at 70 deg.C for formation
of quat. amino from the tertiary amino, and formed into a 5% soln. of
dioxane. The soln. is coated on a glass panel and dried to form a
polymer film 50 microns thick, which is treated with a 1% heparin aq.
soln. at 70 deg.C for 2 hrs. to form a heparin-treated film. (Dwg.0/0)
